IEEE RF Safety Standard History

1960: USASI C95 Radiation Hazards Project and Committee chartered
1966: USAS C95.1-1966
  - 10 mW/cm² (10 MHz to 100 GHz)
  - based on simple thermal model
1974: ANSI C95.1-1974 (limits for E² and H²)
1982: ANSI C95.1-1982 (incorporated dosimetry)
  (comprehensive revision, 250 pages, 1143 ref.)
USAS C95.1-1966 standard (1+ page)

USA Standard
Safety Level of Electromagnetic Radiation
With Respect to Personnel

1. Purpose
Recommendations are made to prevent possible harmful effects on mankind, resulting from exposure to electromagnetic radiation in the frequency range from 10 MHz (megahertz) to 100 GHz (gigahertz). They apply to all radiations originating from radio stations, radar equipment, and other possible sources of electromagnetic radiation such as used for communication, radio-navigation and industrial and scientific purposes. These recommendations are not intended to apply to the deliberate exposure of patients by or under the direction of practitioners of the healing arts.

2. Definitions
2.1 Whole Body Irradiation. Pertains to the case in which the entire body is exposed to the incident electromagnetic energy or in which the cross section of the body is smaller than the cross section of the incident radiation beam.
2.2 Partial Body Irradiation. Pertains to the case in which part of the body is exposed to the incident electromagnetic energy.
2.3 Radiation Protection Guide. Radiation level which should not be exceeded without careful consideration of the reasons for doing so.

3. Recommendations
For normal environmental conditions and for incident electromagnetic energy of frequencies from 10 MHz to 100 GHz, the radiation protection guide is 10 mW/cm² (milliwatt per square centimeter) as averaged over any possible 0.1-hour period. This means the following:

- Power Density: 10 mW/cm² for periods of 0.1 hour or more
- Energy Density: 1 mW/cm²·milliwatt-hour per square centimeter during any 0.1-hour period

This guide applies whether the radiation is continuous or intermittent.

4. Explanation
Exposure to electromagnetic radiation in the frequency range under consideration is but one of several sources of heat input into the body. Body temperature depends in part on sources of heat input such as electromagnetic radiation, physical labor, and high ambient temperature and on heat dissipation capability as affected by clothing, humidity, etc. People who suffer from circulatory difficulties and certain other ailments are more vulnerable. It is also known that details of anatomy, the frequency of radiation, and its penetration affect the percentage of absorbed radiation. Hence, the power levels established by the radiation protection guide numbers are related in a complicated way to power levels at which damage occurs. The guide numbers are appropriate for moderate environments. Under conditions of moderate to severe heat stress the guide number given should be appropriately reduced. Under conditions of intense cold, higher guide numbers may also be appropriate after careful consideration is given to the individual situation. These values are based on an evaluation of presently available knowledge, and with due consideration of tolerable rise in tissue temperature. They may be subject to revision as more knowledge is gained. Radiation characterized by a power level tenfold smaller will not result in any noticeable effect on mankind. Radiation levels which are tenfold larger than recommended are certainly dangerous.

Safety Level of Electromagnetic Radiation
With Respect to Personnel
ICES as the Focal Point in the Global Program for EME Safety Standards

- **Liaison with International Groups:** ICNI RP, WHO, IEC, NATO......
- **Liaison with National Groups:** NCRP, ACGIH, US Fed. Agencies, Canada, China, Ireland......

**IEEE SASB**

**SCC39 ICES (AdCom)**

**Management, Oversight, Fundraising, etc.**

**Exposure Standards**
- **TC-95**
  - SC-1: Measurements & Calculations
  - SC-2: Warning Signs/Hazard Comm
  - SC-3: 0-3 kHz
  - SC-4: 3 kHz - 300 GHz
  - SC-5: EEDs

**Product Standards**
- **TC-34**
  - SC-1: Marine Radar
  - SC-2: Wireless Phones
  - SC-3: RF-Protective Clothing

**Environmental Standards?**
- **TC-XX**
International Committee on Electromagnetic Safety (ICES)

Scope

“Development of standards for the safe use of electromagnetic energy in the range of 0 Hz to 300 GHz relative to the potential hazards of exposure of humans, volatile materials, and explosive devices to such energy. Such standards will be based on established effects and will include safety levels for human exposure to electric, magnetic and electromagnetic fields, including induced currents from such fields, methods for the assessment of human exposure to such fields, standards for products that emit electromagnetic energy by design or as a by-product of their operation, and environmental limits.”
International Committee on Electromagnetic Safety

TC95 Subcommittee 4:

132 members, 42% from outside the US representing the following 23 countries:

SC4 Task for Revision

- C95.1-1991 needs a complete revision
- ICES is committed to the development of a science-based RF safety standard that is protective of public health, unambiguous, and practical to implement
- The RF standard should be harmonized with other international standards to the extent where scientifically defensible
The biological effects of RF exposure have been studied for more than 50 years.

The WHO EMF Project website (http://www.who.int/peh-emf/en/) contains more than 2500 entries, of which more than 1400 are relevant to health effects of RF exposure.

At the close of the evaluation by ICES, 1143 studies were listed in the references.
Weight of evidence:

For purposes of this standard, the outcome of assessing the published information about the biological and health effects from exposure to RF energy. This process includes evaluation of the quality of test methods, the size and power of the study designs, the consistency of results across studies, and the biological plausibility of dose-response relationships and statistical associations.
**Definitions**

**Biological effect:**

An established effect caused by, or in response to, exposure to a biological, chemical or physical agent, including electromagnetic energy. Biological effects are alterations of the structure, metabolism, or functions of a whole organism, its organs, tissues, and cells. Biological effects can occur without harming health and can be beneficial. Biological effects can also include sensation phenomena and adaptive responses.
**Definitions**

**Adverse health effect:**

A biological effect characterized by a harmful change in health

**NOTE 1**—Adverse effects do not include biological effects without a harmful health effect, changes in subjective feelings of well-being that are a result of anxiety about RF effects or impacts of RF infrastructure that are not physically related to RF emissions, or indirect effects caused by electromagnetic interference with electronic devices.

**NOTE 2**—Sensations (perceptions by human sense organs) *per se* are not considered adverse effects. Thus a sensation of warmth at millimeter and other wavelengths and the microwave auditory effect under the underlying special conditions are not recognized as effects to be protected against by this standard. Painful or aversive electrostimulation resulting from exposure at frequencies below 0.1 MHz is treated as an adverse effect.
Established effect:

An effect is considered established when consistent findings of that effect have been published in the peer-reviewed scientific literature, with evidence of the effect being demonstrated by independent laboratories, and where there is consensus in the scientific community that the effect occurs for the specified exposure conditions.

- Science-based recommendations are made to protect against all known adverse effects in human beings associated with RF exposure
- 3 kHz to 5 MHz, minimize effects associated with electrostimulation
- 100 kHz to 300 GHz, protect against effects associated with heating

- Approved by 91.3% of SC4 voting members
- Approved by 96% of ICES and IEEE Standards Association voting members
- Approved by Standards Board October 2005, in print April 19, 2006
C95.1 Standard’s major revision

- A notable revision to the new standard is the recommendation of peak spatial average SAR of 2 and 10 W/kg averaged over 10 g tissue for the lower and upper tier, respectively.
- This revision resolves a major harmonization issue with RF standards.
<table>
<thead>
<tr>

RF Bioeffects Publications

Year

Number of Publications
Ionizing vs. Non-Ionizing Energy

- **Ionizing**
  - Sufficient energy to alter chemical bonds and atomic structure
  - Confirmed health effects include genetic damage
  - Effects can occur from cumulative exposure

- **Non-ionizing (including RF)**
  - Lower energy, insufficient to cause effects like those above
  - Only confirmed RF health effects relate to tissue heating at levels well above limits
  - No known chronic/cumulative effects
Biological Complexity

- **In vivo study**
  - Species
  - Strain
  - Sex
  - Age
  - Extrapolation from animal to humans

- **In vitro study**
  - Monolayer
  - Cell suspension
  - Isolated tissue
  - Extrapolation to human beings
Cataract study
Ophthalmologist looking for cataract
Microwave induced Cataract
In a rabbit eye
Facial burns but no cataract
Engineering Complexity

- Far Field Exposure
- Near Field Exposure
- RF Dosimetry
- Resonance
- Modulation
  - CW, Pulsed
  - AM, FM, TDMA, CDMA
- Experimental Artifacts
- Temperature Control
Health policy must be science based

- A single study can form the basis of an hypothesis, but does not provide the basis for hazard identification.

- Confirmation of the results of any study is needed through replication and/or supportive studies.

- The resulting body of evidence forms the basis for science-based judgments by defining exposure levels for
  - adverse health effects
  - no observable adverse effects
### Biological and Health Effect Studies of RF Exposure in the WHO Database

WHO Comment on Database

- scientific knowledge in this area is now more extensive than for most chemicals.

- *WHO concluded that current evidence does not confirm the existence of any health consequences from exposure to low level electromagnetic fields.*

+ Japan, China, etc.

WHO estimated $250 M already spent on mobile telephony bioeffect research.
Annex B summary

- The biological database established over 50 years shows no repeatable low level RF effect.
- Analysis of proposed mechanisms does not support non-thermal effects at RF frequencies.
- The established effect at lower frequencies is electrostimulation.
- The conclusions from reviews of the scientific database have been remarkably consistent over time confirming the safety and the basis of the IEEE standard.
- Published work following the ICES review has not altered the weight of evidence on health effects.
Animal Cancer Studies: Summary

- All 29 studies since 1992 observed no significant change in tumor incidence except for Repacholi et al. (1997) and Anghileri et al. (2005).
- The few studies reporting effects have not been confirmed by more recent and well-designed studies with good exposure assessment.
- The weight of scientific evidence in 35 studies shows that RF exposure up to lifetime exposure (2 years) does not adversely affect carcinogenic processes (initiation, promotion or co-promotion) at whole-body SAR up to 4 W/kg.
C.1.2 Risk profile for adverse effects

1. RF shocks and burns
2. Localized RF heating effects
3. Surface heating effects
4. Whole body heating effects
5. Microwave hearing effects
6. Low-level effects
“Despite more than 50 years of RF research, low-level biological effects have not been established. No theoretical mechanism has been established that supports the existence of any effect characterized by trivial heating other than microwave hearing. Moreover, the relevance of reported low-level effects to health remains speculative and such effects are not useful for standard setting.”
New IEEE Std. C95.1-2005 pp 1-250

IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz

Sponsored by the IEEE International Committee on Electromagnetic Safety (SCC39)

Johannesburg
October 9, 2007
Slide 37

- Australian Committee on EM Energy Public Health Issues
- European Commission Expert Group

- U.K. National Radiological Protection Board
- U.S. Food and Drug Administration
- World Health Organization
General Conclusion of Expert Scientific Reviews

- No credible evidence that RF exposures within internationally accepted limits cause any adverse health effects, but...

- More research is needed ......

Remarks

- One can never prove the null hypothesis and thus one can never prove that something is absolutely safe.
- There is no known mechanism for adverse health effects of RF exposure other than thermal.
- Due to the current extensive database, it is unlikely that results of ongoing studies will shift the weight of evidence on health effects.
Cellular Transmission Towers

Distance from transmission source  | 3 m  | 15 m  | 30 m  | 124 m | 300 m
---|---|---|---|---|---
Power density per square centimeter*  | .00004 mW  | .00006 mW  | .00004 mW  | .00002 mW  | .00013 mW
Number of times below internationally recognized safety standards**  | 13,750  | 9,167  | 13,750  | 27,500  | 4,230

*1 milliwatt (mW) = 1/1,000 watt
**The ANSI/IEEE and NCRP safety standards for the general public in the environment depicted above are .550 milliwatts per square centimeter
Rooftop Antennas

Residential and office building RF exposures are in general lower than 1% of ICNIRP or IEEE limits, similar to radio and TV broadcast exposure level.
**Promotes Harmonization of Standards**

- Supports WHO harmonization efforts
- Benefits of harmonization
  - *Consumers* gain the protection of an internationally recognized safety standard, and have equal access to products and services that are available to consumers elsewhere in the world
  - *Regulators* can have a consistent approach to regulation consistent with the recommendations of the WHO, the ITU and the WTO
  - *Industry* gains by developing and manufacturing products to a widely accepted international standard and, once tested for compliance, can make those products available around the world in a consistent and timely manner
Conclusions

- IEEE C95.1-2005 provides recommendations to protect against harmful effects in human beings exposed to electromagnetic fields in the frequency range from 3 kHz to 300 GHz.

- A notable revision to the new standard is the recommendation of peak spatial average SAR of 2 and 10 W/kg averaged over 10 g tissue for the lower and upper tier limits, respectively.

- This revision resolves a major harmonization issue with RF standards.

- Cooperative efforts should be continued to achieve internationally harmonized exposure limits.
Science should converge to achieve **one global standard**

Thank you
