**Typically unnatural leaf wilt  
in the tree top area exposed  
to high frequency radiation**

Spatially irregular exposure of free standing trees occurs almost exclusively in the built-up environment. Therefore, irregular damage patterns as shown in this picture are also almost exclusively found in the built-up environment.

## Spatially homogeneous leaf wilt

**HF-transmitter**

**Exposed tree top:  
Unnatural, spatially  
inhomogeneous leaf wilt**

## **Explanatory Model for the Timeline Sequence „The Three Lime Trees“**

Mainly due to their position within the built-up environment, the three lime trees are exposed in different ways. They exhibit spatially different damage structures with different damage timelines. The exposure conditions in this case are simple and straightforward for anyone familiar with the propagation of high frequency radiation: The radiation is diffracted (bent downwards) by the roof ridge of the light blue house. Lime tree number 1(left) has the highest position. Its transmitter facing side suffers full height exposure to the diffracted high frequency radiation. The exhibited damage is also transmitter facing, i.e. it originates on the side facing the source of the radiation and expands in the direction of the radiation. The smaller lime tree number 2 has the lowest position and is shielded by the surrounding buildings. The propagation path of the diffracted radiation goes straight past its tree top. This tree does not exhibit any transmitter facing damage and sheds its leaves only in mid-November and with a regular pattern of wilting. Lime tree number 3 is positioned in a way which exposes part of its tree top to the diffracted radiation from the transmitter. This tree exhibits the “typical” spatially inhomogeneous (irregular) damage, expressed by the unnatural premature wilting of the leaves in the tree top. A situation where free standing trees are only partially exposed to high frequency radiation (i.e. only in their tree tops) can usually only be found within the built-up environment. Hence, this particular pattern of damage is also almost exclusively found in free standing deciduous trees within a built-up environment.

# P)))ULS-SCHLAG DVD-Video P)))ULS-SCHLAG

Die rasante Ausbreitung der Mobilkommunikation und vielfältiger Funkanwendungen hat zu einer neuen, globalen Umweltbelastung durch modulierte, hochfrequente, elektromagnetische Wellen geführt. Die drei Referenten gehen umfassend und leicht verständlich auf die Problematik chronischer Hochfrequenzbelastungen ein.

Frau Dr. Mauser schildert ihre ärztlichen Erfahrungen in der medizinischen Praxis seit der Inbetriebnahme dreier Mobilfunksender in ihrer Gemeinde vor über sieben Jahren. **ca. 20 min**

Dr. Schorpp stellt einfach und klar die Mobilfunktechnik und das Zustandekommen der Grenzwerte vor. Anschaulich vermittelt er die Wirkung modulierter Hochfrequenzstrahlung auf das signalverarbeitende biologische System. Weil der Mensch keine bewusste Wahrnehmung für derartige elektromagnetische Wellen hat, demonstriert Dr. Schorpp eindrucksvolle Experimente mit hörbaren Schallwellen, um die biologischen Wirkungen "erlebbar" zu machen. Er erläutert, wie Menschen, Tiere und Pflanzen unter der Strahlung leiden und zeigt Letzteres ausführlich anhand einer beeindruckenden Bild-Dokumentation von Baumschäden, die kaum einen Zweifel an einem ursächlichen Zusammenhang mit den Senderstandorten zulässt. **ca. 1 h 45 min**

Frau Dr. Waldmann-Selsam erläutert anhand einzelner Fallbeispiele die wesentlichen Ergebnisse ihrer ärztlichen Erhebungen an mehr als 220 Mobilfunkstandorten. **ca. 20 min**

**Bitte erwerben Sie die DVD käuflich! Der Erlös fließt in gute Projekte, wie z.B. einen Foto-Wettbewerb zur Dokumentation von Baumschäden.**

Diese DVD erhalten Sie bei: PULS-SCHLAG e.V., [www.puls-schlag.org](http://www.puls-schlag.org), Email [puls-schlag@web.de](mailto:puls-schlag@web.de), Tel. 0721 84 08 67 58, Kto: 53 66 097, BLZ: 660 908 00, Badische Beamtenbank Karlsruhe. **P)))ULS-SCHLAG** invites you to participate in our

# Open End Photo Competition

We will award the best photographically documented timeline sequences of tree damage demonstrating the relationship between chronic high frequency radiation and tree damage.

First round of awards: 2008

**1. Prize      500 €**

**2. Prize      300 €**

**3. Prize      200 €**

**Please participate !**

We are still looking for national and international partners
