

# EHS: A world first in France with scientific proof from comparative encephaloscans

The EHS have a right to live, but in France and in most other countries, due to the pressure from the industry lobbies, they have no recognition and they are not accorded this inalienable right. Their need to survive leaves them no choice, so it is quite legitimate for them to take their future in hand.

Ignorance of the basic facts of electromagnetism is carefully fostered by the lobbies. It is natural electromagnetic energy that is the basis of creationist theories on the origin of life on earth, a theory that is a parallel to the Darwinian theory of evolution.

To make it simple: we are all born EHS, as the human organism is entirely bio-electromagnetic, since all the exchanges between our cells function thanks to electromagnetism. We lose this condition when we die and the exchanges cease, and our electroencephalogram goes flat. The problem is that most people are completely ignorant of this truth. In other words the condition of being electrosensitive is innate, and the degree of it varies with different people and in different environments.

The main factor that aggravates this condition is the new artificial electromagnetic pollution that has never existed on earth until now, the worst being that of radiation in the HF microwave spectrum from mobile phone communications (similar to those concentrated in microwave ovens).

As for the shorter wavelengths of these artificial electromagnetic frequencies, this pollution is concentrated in nuclear reactors - it is exactly the same but on a different scale, and who knows this? In fact the shorter the wavelength, the more energy is discharged, which is why there are so-called safety areas (in fact danger zones) around phone masts and mobile phones.

Where the shorter wavelengths (eg. GHz) are in use, as in the Hertzian Repeaters relaying mobile signals, there is [a strict ban on parking within the radiation beam](#), whatever the distance from the source, even kilometers away, since the radiation is lethal in a very short space of time.

The interaction of artificial EMFs with the bioelectromagnetic human metabolism provokes pathologies that are described in [The Microwave Syndrome](#) [Dr C. Monnet and Prof. le Ruz, with video].

In the scientific literature it is Dr Richard Gauthier who has detailed [\[scientific dossier\]](#) the mechanisms of the interactions in the proteins of the cellular membrane when they are exposed to artificial EMFs from HF microwaves, which trigger a chain reaction affecting calcium levels, activation of enzymes and the creation of stress proteins.

It is the enzymes that trigger the chain reaction, then, if the signal persists, the stress proteins block various processes within the cell, affecting for example the messengers between the brain cells called neuromediators, which consequently alter the activity of the brain.

## Scientific world first in the Forêt de Saoû: comparative encephaloscans

Why choose the Forêt de Saoû?

Nowadays in France there are very few White Zones with no or very little artificial EM radiation (such as the EHS Refuge Zones). Such places can of course only exist in the wild, where there are no inhabitants or any of the usual practical resources, thus the EHS have very little choice of places to live.

**The Forêt de Saoû is a listed natural zone without inhabitants, so it is a place where the EHS can live. This unspoilt area is the site of an experiment which has been ongoing not just for a few weeks, as one might think from the current media interest in what is happening there, but since January 2010.**

It is a world first which demanded a great deal of courage from Philippe, an EHS who acted as guinea pig and lived there on his own for several months during the particularly harsh winter of 2009-10. His only contact was with the forest wardens present during the day.

The presence of Philippe, "the hermit guinea pig", in his camper van in the forest did not go unnoticed. His medical condition was tracked by the Association de Recherche Thérapeutique Anti-Cancéreuse (ARTAC), which is an independent group of doctors and researchers based in Paris, who specialize in the biological, therapeutic and clinical study of cancer. This research includes the EHS, and a group headed by Prof Dominique Belpomme is studying their condition with a considerable number of EHS. An update on their work, [État des lieux des recherches de l'ARTAC sur les EMS et l'EHS](#) [Fr], was published on 18 December 2009.

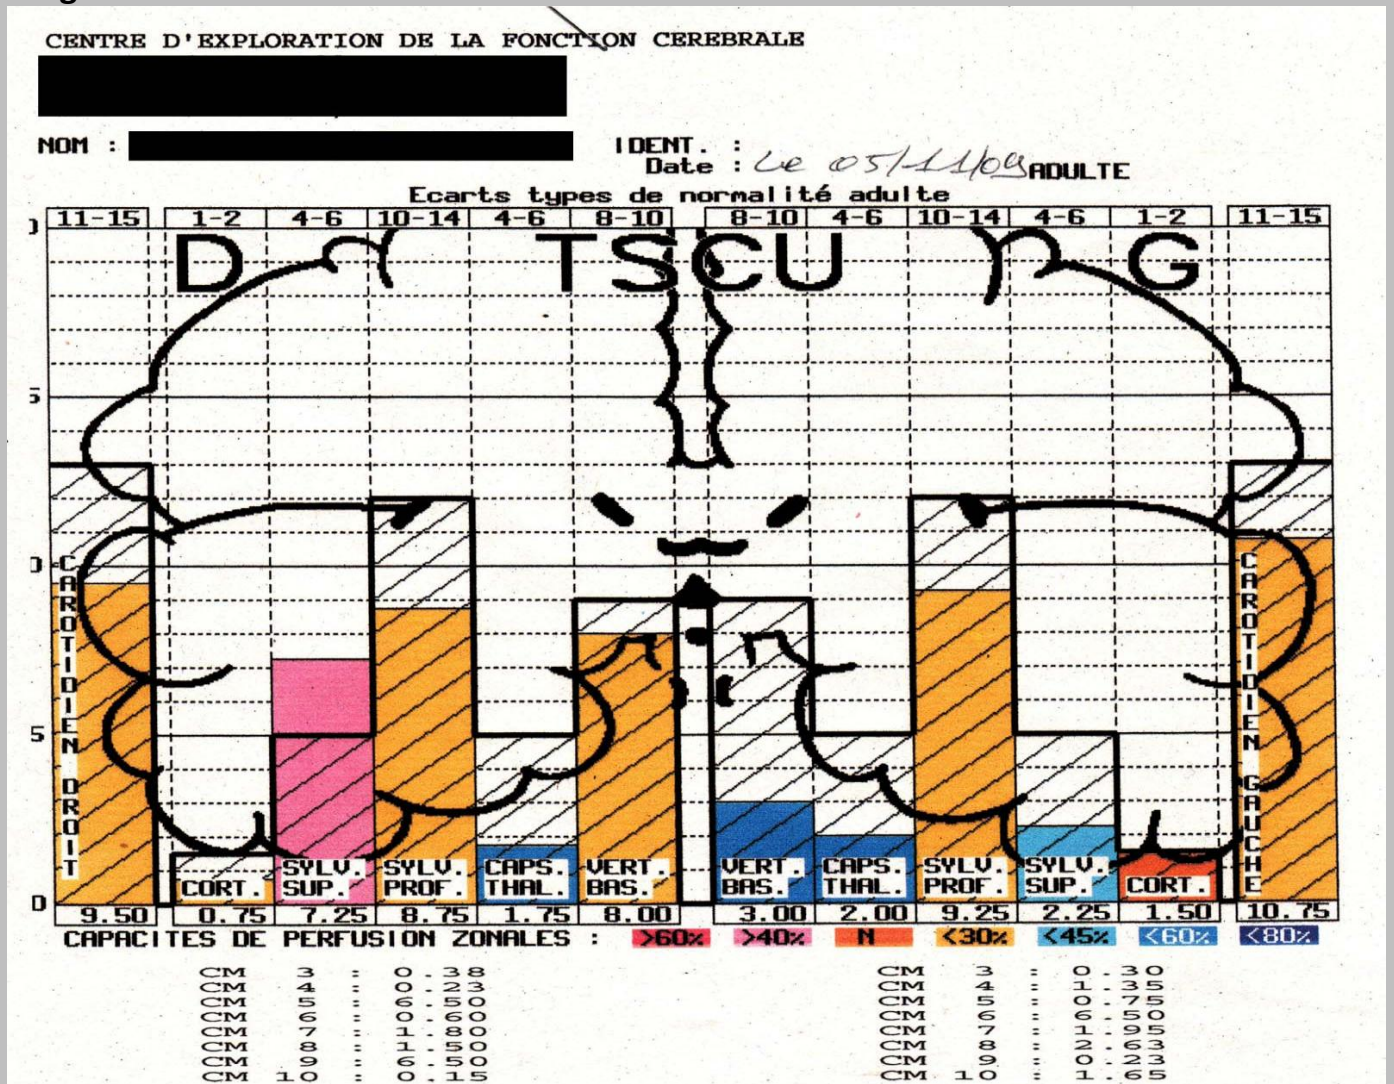

Philippe underwent various medical examinations before his stay in the forest, including an encephaloscans at the Centre d'Exploration de la Fonction Cérébrale run by Dr Ph Lebar in Paris.

An encephaloscans is currently the best diagnostic marker of symptoms in the brain of people who are EHS.

It provides scientific proof of the EHS condition.

This scan gives an image of the arterial irrigation of the two hemispheres of the brain. The results are analysed by comparison with standard variations. In the columns in the diagram, the zones with adequate circulation are indicated in red and orange, and the zones that are not getting enough are marked in yellow and blue.

Diagram 1

CENTRE D'EXPLORATION DE LA FONCTION CÉRÉBRALE PARIS

Diagram 1 represents the encephaloscans of Philippe EHS before his arrival in the Forêt de Saoû. It is clear that after living for several years in an average town and being exposed to its artificial electromagnetic microwave pollution, he is in a weakened state. In this first diagram the circulation levels in several areas of both hemispheres are seen to be seriously affected.

## CENTRE D'EXPLORATION DE LA FONCTION CÉRÉBRALE PARIS

**Diagram 2** represents the encephaloscans of Philippe EHS after living 3 months in the Forêt de Saoû (an area with very low artificial EM radiation). A spectacular improvement can be seen in the circulation in the 2 hemispheres of the brain. Visible physical consequence: Philippe was no longer in a weakened state.

(Extract of the results: the 5th section corresponds to the capsulo-thalamic region of the right hemisphere, which has gone from an abnormally low rate of circulation to a correct level.)

This scientific experiment provides proof that ought to open the eyes of the health authorities to the urgent need to legislate immediately on a drastic reduction of permitted levels of EM radiation, and on the creation of Refuge Zones for the EHS in every region of every country, along with mapping the Hertzian radiation in every community so that residents can know the level of radiation in each neighbourhood,

In addition, all the electronic information panels posted in urban areas should include along with the date and the temperature, a meter that displays the level of ambient radiation, since this information is crucial for older people, pregnant women and all those in a weakened state of health, or actually ill, who are in the area.

Meanwhile the rare places still untouched by artificial electromagnetic pollution are more than precious, and are the only places where the EHS can go to improve their state of health. In fact for those who have to live as recluses, often in very poor health, they are the only places where they can still survive.
